Project Title:

Adventure Tracker

Project Members:

Alexander Stevens

Project Description:

Adventure tracker is an app that lets people use their real time location to mark locations of interest. Users can upload photos of the location in question, take notes, and give the location an overall rating. Users do this by tapping on a map and a little mark will pop up for that location where they can then fill in the info. The marks on the map are color coded based on the rating the user gives the spot. This app allows users to optionally share information on spots they create by uploading their chosen data over the internet onto a backend. If users choose to share that location it will be visible to everyone on the app. There will also be features to list nearby places of interest and for users to filter locations based on rating and other metrics such as type of location (food, hiking, shopping, etc). This filtered information will be on a separate page to allow for the full detailed reviews to be shown, rather than being blocked by the map. On this detailed information page, users can also see saved reviews and reviews posted by them.

Project Implementation Details:

A. I am building for the web but will try to get my app running natively on android as well.
B. I plan on having a User table that stores a unique username, email, and password so each user can have an account. I also plan on having a Review table that stores information related to each location's name, coordinates, activity, photo and the review the user gave that location along with whether the review is publicly visible or not. This information will be stored in a firebase database.

User Interface:

Reviews

Review for Pizza Shoppe
By Bob
Location: 112, 123
Rating: 4/5
Description: I liked the pizza, but I wish there was more options for dessert!

Review for Coffee Truck
By Jill
Location 445, 445

Project Deliverables and Timeline:

C. Deliverables

- **1. Expected:** Create **Homepage** for app that looks nice and links to the major features of the app
- **2. Expected:** Create and connect app to SQL database, make models for users and reviews (this can be done with a locally hosted SQL database first, then move to cloud)

- **3. Expected:** Create the **Add Review page** where users fill out a form with the coordinates, rating, and name of the location along with some optional details like a description of why the user rated the place they did
- **4. Expected:** Create the **Reviews page** where users can view the reviews in the database
- **5. Expected:** Create the **Profile page** where users can see their username and account info
- **6. Expected:** Add tab to Reviews page allowing users to see all their own reviews
- **7. Expected:** Let users fully focus on a review by tapping on it, making it the only review on the page, and a way to go back
- **8. Expected:** Add the **Explore page**, where we get the user's current location and show them a map of the area, try using flutter_map for maps but if it won't work then use Google maps
- **9. Expected:** Have reviews show up on the map as markers and let users tap on the review to get a quick preview, along with a button that lets users see full review by taking them to the Reviews page
- **10. Expected:** Let users add a photo to represent the location in their review, do this by letting app request access to user's filesystem (try getting this to work on Android too)
- **1. Stretch:** Add advanced filtering features to Reviews page, such as sorting reviews by which location is closest, sort by activity, sort by date posted, etc
- **2. Stretch:** Allow users to save reviews they like and have a "Saved" tab in the Reviews page
- **3. Stretch:** Add ability to tap on empty spot on map which will prompt the user if they want to create a review for the spot, if they do then it will automatically fill in the coordinates part of the review based on where the user clicked
- **4. Stretch:** Add ability for users to hide review markers on the map and ability to make them visible again (keep a hidden list)
- **5. Stretch:** Find a way to deal with long reviews, maybe cut them off? Or maybe only show certain things and show the rest of the review only if the user clicks on that review
- **6. Stretch:** Let users change their username, email, and password in accounts, let them also set a profile picture and show that next to their name on reviews

D. Organization and Timeline

- I plan to complete the list of deliverables above one after the other. I ordered it in such a way so I start with the easiest features and then later work on the harder features and the features that are built on other features. I need to complete my deliverables at a pace of around 2 a week to get an MVP. After getting that MVP I will then probably have 2-3 weeks left to work on my stretch goals and polish my app. During this period I will also focus more on the visuals of my app. For creating the MVP I will focus mainly on the core logic and features rather than making it polished or visually appealing.
- **Milestones** (complete these by end of semester week):

- Semester Week 7 (complete by March 8th): complete first two deliverables
- Semester Week Week 8: deliverables 3-4
- Semester Week Week 9: deliverables 5-6
- Semester Week Week 10: deliverables 7-8
- Semester Week Week 11: deliverables 9-10
- Semester Week Week 12: stretch goals 1-2
- Semester Week Week 13: stretch goals 3-4
- Semester Week Week 14: stretch goals 5-6
